

Guide for Acoustic Identification of Florida bats

Family:

Vespertilionidae

Database species code

Corraf or Cora

See glossary for explanation of codes

Scientific name

Corynorhinus rafinesquii (Lesson, 1827)

Taxonomy follows Simmons and Cirranello (2021)

Call shape

To view call graphics click on the camera icon on the right. You can then move through all images by using the left or right arrow keys. A left mouse click returns to the fact sheet.

Broad band FM reversed "J" with pulses appearing nearly vertical. As a large eared vespertilionid this species vocalizations are fairly quiet, i.e., low intensity. See notes. Call images are from hand released bats therefore call pulses would not likely be typical of free flying search phase calls. Generally, vespertilionids emit "clutter" calls on hand release that are broader in bandwidth, higher in frequency and shorter TBC than free flying search phase calls. Two zero-crossing displays of the calls (AnalookW 4.5.w).

Vocal signature parameters

Call parameters are not robust/reliable at this time for definitive free flying identification. This large eared bat emits low intensity calls and may not be adequately recorded in the field as free flying bats. Parameters provided here have been extracted from files provided by Corben (top) and Finn (below) from hand released bats. These are primarily "clutter" calls and may not accurately reflect diagnostic free flying search phase calls.

From Corben data

Parameters N	Min	Max	Mean	St.Dev	10%	25%	75%	90%

Conservation status

Least concern; Ver.3.1 ; Population trend - increasing; evaluated 2008. (I.U.C.N. 2017.)

Notes

Britzke (2001) excluded calls of this species when evaluating the efficacy of acoustic detectors in a study of the ecology of bats in the eastern U.S due to the difficulty of detecting low intensity calls. In addition to low intensity calls that may be difficult to detect harmonics are often present. Call-shape simple linear FM sweep. Sometimes calls include an upsweep or flat tone at onset before sweeping downward (Szewczak, 2018).

The large frequency range reflects this species' characteristic of sometimes applying more amplitude in the second harmonic than in the first. Lo F (and Fc) of the first harmonic typically ranges from ~19–27 kHz Szewczak (2018).
