Distribution of *Glyptophysa (Glyptophysa) novaehollandica*.

Disclaimer

This genus is in need of revision, as the species concepts we have used have not been rigorously tested. Unpublished molecular data indicate that the species units we are here using appear to be justified, however they are not accompanied by clear-cut morphological characters that allow separation based on shell characters alone. As the species units appear to be overall concordant with state boundaries, we have used these boundaries to aid delimiting species. This situation is not ideal, and can only be resolved by additional molecular and morphological studies involving dense sampling.

Diagnostic features

The taxonomy of *Glyptophysa* is very poorly understood. This is one of several species of relatively smooth shelled *Glyptophysa* that are variable in shape and in periostracal development (periostracal hairs and spirals can be present), even within a single population. A large number of species-group names are available and it is quite possible that more species occur in Australia. At present we are recognising only three, in addition to *G. aliciae*.

This species is one of three that we are somewhat tentatively recognising (see statement under Notes) that were previously referred to as *Glyptophysa gibbosa* (now treated as a synonym of *G. novaehollandica*). These taxa are in need of revision, as the species concepts we have used have not been rigorously tested.

Classification

Glyptophysa (Glyptophysa) novaehollandica (Bowdich, 1822)

Common name: Pouched snail

Class: Gastropoda

Infraclass: Heterobranchia

Megaorder: Hygrophila

Order: Lymnaeida

Superfamily: Planorboidea

Family: Planorbidae

Subfamily: Miratestinae

Genus: *Glyptophysa* Crosse, 1872

Subgenus: *Glyptophysa*

Original name: *Physa novaehollandica* Bowdich, 1822 (as *Physa n.hollandica*). Bowdich, T. E. (1822).

Elements of Conchology Pt. 1. Paris.

Type locality: Assumed to be New Holland (= Australia), based on the name.

Synonyms: *Physa novaehollandiae* Lesson, 1831; *Physa novaehollandiae* Gray, 1833; *Physa ludwigii* Küster, 1844; *Physa gibbosa* Gould, 1846; *Physa pectorosa* Conrad, 1850; *Physa australiana* Conrad, 1850; ?*Physa circumlineata* Morelet, 1857; *Physa concinna* A. Adams & Angas, 1864; *Physa olivacea* A. Adams & Angas, 1864; *Physa badia* A. Adams & Angas, 1864; *Physa aciculata* Sowerby, 1873; *Physa dispar* Sowerby, 1873; *Physa pyramidata* Sowerby, 1873; *Physa tenuistriata* Sowerby, 1873; *Physa subundata* Sowerby, 1873; *Aplexa adamsiana* Tapparone-Canefri 1874; *Physa duplicata* G. B. Sowerby, 1874; *Physa aperta* Sowerby, 1874; *Physa nitida* Sowerby, 1874; *Physa attenuata* Sowerby, 1874; *Physa pinguis* Sowerby, 1874; *Physa brunniensis* Sowerby, 1874; *Physa eburnea* Sowerby, 1874; *Physa mamillata* Sowerby, 1874; *Physa nitida* Sowerby, 1874; *Physa texturata* Sowerby, 1874; *Physa bullata* Sowerby, 1874; *Physa kershawi* Tenison Woods, 1878; *Physa huonensis* Tenison Woods, 1876; *Physa legrandi* Tenison Woods, 1876; *Physa tasmanica* Tenison Woods, 1876; *Physa huonicola* Tenison Woods, 1876; *Physa tasmanicola* Tenison Woods, 1876; *Physa ciliata* Tenison Woods, 1876; *Physa yarraensis* Tenison Woods, 1878; *Physa diemenensis* Johnston, 1879; *Physa fumiformis* Nelson and Taylor, 1879; *Physa beddomei* Nelson & Taylor, 1879; *Physa brisbanica* Nelson & Taylor, 1879; *Aplexa turrita* Tate, 1881; *Physa exarata* Smith, 1882; *Physa gracilentia* Smith, 1882; *Physa etheridgei* Smith, 1882; *Physa queenslandica* Smith, 1882; *Physa lessoni* Smith, 1882; *Physa grayi* Smith, 1882; *Physa smithi* Clessin, 1885; *Physa krefftii* Clessin, 1886; *Physa multispinata* Clessin, 1886; *Physa conica* Clessin, 1886; *Physa lincolnensis* Clessin, 1886; *Physa waterhousei* Clessin, 1886; *Physa producta* Smith, 1882; *Physa tortuosa* Clessin, 1886. *Physa arachnoidea* Tenison Woods, 1878; *Isidora gibbosa brevispira* Odhner, 1917; *Bullinus tenuistriatus confluens* Hedley, 1917; *Amerianna subacuta* Cotton & Beasley, 1941; *Tasmadora sorellensis* Cotton, 1943; *Lenameria calda* Iredale,

1944; *Lenameria digressa* Iredale, 1944; *Lenameria epicropa* Iredale, 1944; *Lenameria formalis* Iredale, 1944; *Lenameria placata* Iredale, 1944; *Lenameria pretena* Iredale, 1944; *Lenameria renola* Iredale, 1943; *Mutalena modica* Iredale, 1944; *Mutalena raperta* Iredale, 1944.

State of taxonomy

The taxonomy of *Glyptophysa* is very poorly understood. A large number of species-group names are available and it is quite possible that more species occur in Australia.

This species is one of three that we are somewhat tentatively recognising (see statement under Notes) that were previously referred to as *Glyptophysa gibbosa* (now treated as a synonym of *G. novaehollandica*). These taxa are in need of revision, as the species concepts we have used have not been rigorously tested.

Biology and ecology

On water weeds, wood, and similar substrates, in ponds, billabongs, swamps, and sluggish streams and rivers. Feeds on algae and detritus. Egg mass typically a bean(kidney)-shaped jelly strip containing many small eggs. Development direct.

Distribution

This species, as tentatively recognised, is found in northern, central, eastern and south-eastern Australia and Tasmania.

Notes

This genus is similar to the common introduced *Physella* (Physidae) in that both have similar-shaped, sinistral shells. *Glyptophysa* (*Glyptophysa*) can be distinguished by the shell not being completely smooth (as it is in *Physella*), *Glyptophysa* (*Glyptophysa*) often having some periostracal ornament and microscopic wrinkles or spiral ridges in the case of *Glyptophysa* (*Glyptophysa*) *aliciae*. *Physella* has a mottled mantle which can usually be seen through the semi-transparent shell whereas *Glyptophysa* (*Glyptophysa*) has a uniformly dark-coloured mantle. The animal of *Physella* has digitations (finger-like processes) along the mantle edge against the columella whereas this is smooth in *Glyptophysa*. (*Glyptophysa*). *Physella* lacks a false gill (pseudobranch) which is present in *Glyptophysa* (*Glyptophysa*) and all planorbids. The animal of *Glyptophysa* (*Glyptophysa*), if damaged when alive, has red-coloured blood whereas *Physella* does not produce coloured blood.

Glyptophysa differs from the otherwise similar genus *Isidorella* in the penial apparatus having a penial stylet and an accessory flagellum. *Isidorella* lacks a stylet and an accessory structure but the penis has two lobes.

This species was previously known as *Glyptophysa gibbosa*, but *G. novaehollandica* is an earlier name.
