

Megalurothrips usitatus

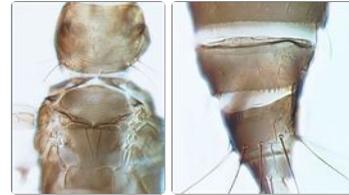

Distinguishing features

Female macroptera. Body brown; tarsi, apices of mid and hind tibiae, also most of fore tibiae yellow; antennal segment III yellow to light brown; hind tibiae with 2 stout dark apical setae; fore wings brown with basal quarter pale and an extensive pale area sub-apically. Antennae 8-segmented, III-IV with constricted apical neck, sense cone forked. Head as wide as long; 3 pairs of ocellar setae present, pair III on anterior margins of ocellar triangle and longer than distance between compound eyes; postocular setae small. Pronotum with 2 pairs of long posteroangular setae, posterior margin with 3 pairs of setae; anteroangular setae well-developed. Metanotum with weak sculpture; campaniform sensilla present, median setae arise at anterior margin. Mesofurca with spinula. Fore wing first vein with long row of setae before distinct subapical gap followed by 2 setae; second vein with complete row of setae. Tergites without sculpture medially, ctenidia absent; tergite VIII with irregular group of microtrichia anteromesad of spiracle, posteromarginal comb of slender microtrichia but broadly absent medially. Sternites without discal setae; median pair of marginal setae on sternite VII arise in front of margin.

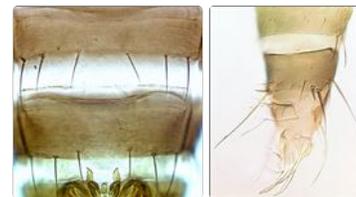

Male macroptera. Similar to female but smaller and paler, legs sometimes almost yellow; tergite IX posterior margin without paired setiform processes, posterolaterally with pair of short very stout setae; sternites without pore plates.

Female Antenna Head & pronotum

Pro meso & metanota Tergites VII-X

Sternites VI-VII Male tergite VIII-IX

Fore wing

Related species

Fourteen species are currently listed in *Megalurothrips*, all from Old World areas between Africa, China and the Pacific. However, the validity of some of these species is open to doubt, including some of those most recently described. *M. usitatus* is the most common and widespread member of the genus through the Oriental Region to the Pacific, and is common in northern Australia. Females can be difficult to distinguish from several other named species (Palmer, 1987).

Biological data

Feeding and breeding in the flowers of various Fabaceae, including crops such as *Glycine*, *Arachis*, *Vigna*. Members of *Megalurothrips* are commonly associated with damage to bean crops through feeding in the flowers.

Distribution data

Widespread in the Oriental Region from India to Japan, also Fiji and Australia. Found across northern Australia, from Western Australia to Queensland and northern New South Wales.

Family name

THRIPIDAE - THRIPINAE

Species name

Megalurothrips usitatus (Bagnall)

Original name and synonyms

Frankliniella nigricornis Schmutz, 1913: 1020

Frankliniella obscuricornis Schmutz, 1913: 1022

Frankliniella vitata Schmutz, 1913: 1023

Physothrips usitatus Bagnall, 1913: 293

Physothrips cinctipennis Bagnall, 1916: 217

Physothrips mjobergi Karny, 1920: 37

Taeniothrips longistylus Karny, 1922: 99.
